

Buy Sustanon 250 (4 testosterone esters), 250 mg / ml (10 ml) Max Pro (Thailand), - 44 €

Pharmaceutical name: Testosterone (both 30 mg propionate, 60 mg isocaproate, 60 mg as phenylpropionate, 100 mg decanoate)

Chemical structure: 4-androsten-3-one, 17beta-ol

Molecular Basis weight: 288.429

molecular weight ester: 74.0792 (propionic acid, 3 carbon atoms)

The molecular weight ester: 116.1596 (isocaproic acid 6 carbon atoms)

molecular weight ester: 150.1768 (propionic acid phenyl ester, 9 carbon atoms)

molecular weight ester: 172.2668

Sustanon 250 is inj insulating oil based, containing four different compounds of testosterone: testosterone propionate, 30 mg; testosterone phenylpropionate, 60 mg; testosterone isocaproate, 60 mg; and testosterone decanoate, 100 mg. Smes testosterone released a lot of time to provide an immediate effect while remaining active in the body for months. As in other testosterones, Sustanon is androgenic steroid with a pronounced anabolic effect. Thus, athletes typically use Sustanon to put on weight and size, increasing strength. However, unlike the other compounds, such as testosterone, testosterone cypionate and testosterone enanthate, Sustanon use results in less water retention and estrogenic side effects. This characteristic is extremely beneficial to bodybuilders who suffer from gynecomastia yet still seek the powerful anabolic effect of injectable testosterone. Sohranenie decreased water also makes Sustanon desirable steroid for bodybuilders and athletes interested in cutting up or building a solid foundation of quality mass. Sustanon dose range of 250 mg every two weeks, 2000 mg or more per week. These dosages seem kraynosti. Bolee common dose will be in the range from 250 mg to 1000 mg per week. Although Sustanon remains active for one month, injections should be taken at least once a week to keep testosterone levels stable.

A steroid novice can expect to receive about 20 pounds within a few months by using only 250 mg of Sustanon a week. More advanced athletes obviously need higher dosages to obtain the desired effect. Sustanon is a fairly safe steroid, but in high dosages, some athletes may experience side effects associated with elevated estrogen levels. With doses exceeding 1000 mg per week is probably reasonable to use anti-estrogens such as Nolvadex (tamoxifen citrate) or Proviron® (mesterolone). Using Sustanon suppresses natural testosterone production, so the use of HCG (human chorionic gonadotropin) or Clomid (clomiphene citrate), may be appropriate at the end. Sustanon 250 is a good base steroid to use in a stack. Athletes interested in rapid size and is growing to find that Sustanon stacks extremely well with oral like Anadrol? (oxymetholone) and Dianabol (methandrostenolone). On the other hand, well-formed Sustanon with Parabolan (trenbolone hexahydrobencylcarbonate), Masteron (drostanolone propionate) and Winstrol® (stanozolol) for athletes seeking hard ripped look.
